TRY CYNGULAR

Cyngular® is a cutting-edge, device--agnostic patient engagement and monitoring solution that augments EMR-native portals by solving the need for proactive patient care, continuous patient engagement, and timely interventions without overburdening care teams or IT resources and driving adoption rates above 75%. The platform accelerates existing outreach and engagement initiatives, enriches population health data collection, and increases cohesion between patient outreach, experience, and clinical workflows. It's more cost-effective and intuitive than device-dependent RPM programs, allowing patients to connect via the devices they're already using versus mandating expensive wearables. The multilingual patient access interface is rapidly adaptable to English, Spanish, French, Mandarin, and more.

Beyond EMR Portals

- Cyngular® augments patient portals, filling gaps in their reach and capacity for proactive engagement. While Portals are visit-bound, Cyngular® sustains ongoing connection between patients and the provider between visits, as well as vitals monitoring, real-time alerts, and full medication management.

Clinical Impact

- Providers have total control over outreach intervals, patient populations, and which vitals, symptoms, and medications are tracked. Triage cues and red-flag escalation through staff-first routing ensure timely interventions, transform passive data collection, and prevents the physician burnout that plagues portal-based messaging systems.

Measurable Outcomes and Value

- Cyngular® delivers tangible results: patient participation rates exceeding 75% on average, reduced provider burnout, increased revenue capture through patient retention and improved visibility into population health metrics. At a predictable cost of \$3–\$5 per patient per year with no incremental fees, it provides both clinical and financial impact at scale.

Dynamic Customer Support and Product Improvement

- Cyngular® features vendor-supported implementation without increasing demands on limited IT resources, dedicated and ongoing training for users, and 24/7 issue resolution. AI-driven enhancements can be shaped by direct client feedback, dynamically future-proofing without disrupting established workflows.
