EPILOG HEALTH ANNOUNCES MAJOR, CYNGULAR® DISCOUNT PROGRAM FOR RURAL HOSPITALS

CYNGULAR® – AI-BASED PATIENT ENGAGEMENT SOLUTION

Fairfax Station, VA May 11, 2026 — (<https://newswire.com>) — Epilog Health LLC announces a 30% discount program for Rural Hospitals, ensuring that healthcare facilities serving rural communities can access advanced AI technology that improves at-home patient engagement, expand care and retention.

Rural Hospitals play a critical role in providing essential healthcare to rural and dispersed populations. However, limited budgets often make it difficult for these hospitals to implement cutting-edge technologies that enhance patient care. Epilog Health is committed to bridge this gap by making Cyngular® more accessible through this new pricing initiative.

Launched in 2024, Cyngular® is an AI-powered patient engagement platform that goes beyond traditional EMR-based portals by offering continuous patient engagement, expanded population health data collection, patient retention and increased proactive care opportunities. The platform has already demonstrated success in boosting patient participation, expanding outreach to at-home patient populations, and improving overall healthcare outcomes.

The Rural Hospital Discount Program for Cyngular® is available immediately. Hospitals interested in learning more can contact Epilog Health at engage@epiloghealth.com for a preliminary proposal.

About Epilog:

Epilog Health LLC, located in Northern Virginia, has been a national provider of clinical document solutions to healthcare facilities. Its solution portfolio of NuSPEECH®, NuSCRIBE®, NuCHART™, ChartMD™, PortalMD™, Cyngular® and other solutions are in wide use.

Cyngular® | Patient Engagement Solution for healthcare facilities and providers.

The Solutions | A significant gap exists between at-home patients and providers for monitoring health conditions and providing care. The current partial solutions do not adequately address the needs of at-home patients. For providers and healthcare facilities, these are missed opportunities in providing Proactive and Preventive care for at-home patients.

EMR Patient Portals – Every major EMR system (EPIC, Cerner, Meditech, Tru Bridge, Veradigm and others) provide patient portal. These patient portals fall in the category of ‘visit-follow-up’. Patients manage appointments, obtain medication refills, and get results from their visits. The patient communication with facility and providers is limited to the visit (event based or routine check-ups).

Wearable Remote Patient Monitoring – WRPM solutions are available for Remote Patient Monitoring. These solutions require at-home patients to have specific monitoring devices and require patient training in operating this network connected devices. While highly effective these solutions carry a high-cost factor of \$3,000 to \$5,000, they suffer from at-home WIFI network availability and quality. These factors have limited device specific patient monitoring solutions for at-home patients with critical care needs. Demographically, this is 7% of at-home patient population.

Right Solution | Cyngular®, the AI based solution addresses large population of at-home patients currently not addressed by Wearable Remote Patient Monitoring solutions. The solution features of Cyngular® (listed below) are designed to effectively service large segment of at-home patients. Does not require specific monitoring devices.

- Cost per patient per year averages \$10 or less
- Patient secured WEB access in English and Spanish
- Patient access via PC, MAC, Tablet or Phone
- Collects patient health vital data at defined frequency
- Includes medication management
- Includes patient-provider messaging

Effective implementation, wider-use solution, ease of use and continuous patient engagement are the core features that make Cyngular® highly effective. Cyngular® complements EMR Patient Portals by adding continuous patient engagement.
